Meridian Nexus, built around the store visit

Sales reps and merchandisers are the primary users. Managers and clients use the evidence to guide action.

What field teams need

SALES REPS

Call cycle and store context;
quotes, orders and returns;
clear approval and fulfilment status.

MERCHANDISERS

Attendance, shelf availability,
price and promotion checks;
Stock Fix tasks with photo proof.

FIELD VALUE

Accepted orders, verified shelf work and clear ownership of follow-ups. Measure coverage, availability and task closure.

NON-NEGOTIABLE

Offline capture, reliable photo sync, one sign-in and client/store access. About 1,000 total users; field, office and client licence split to confirm.

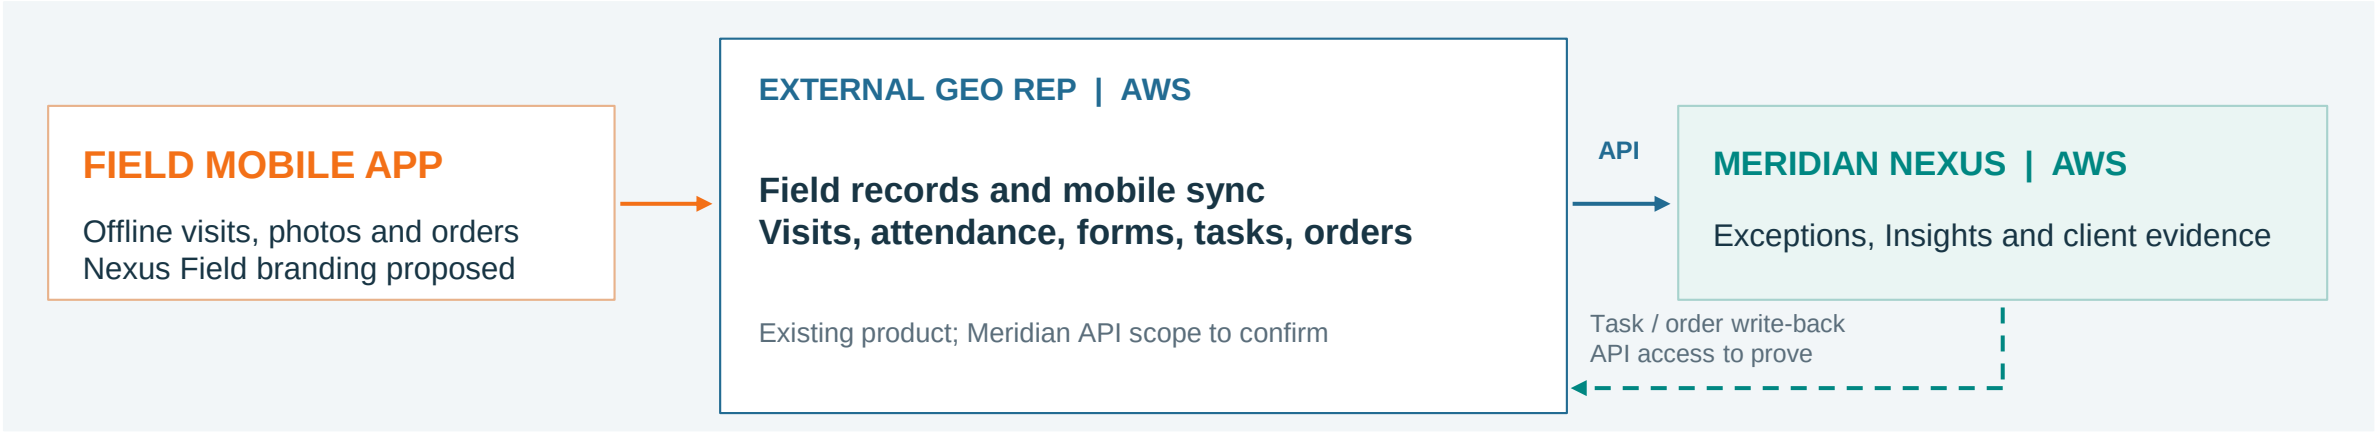

HOSTING DECISION

Move Nexus to AWS with Geo Rep. Meridian-owned account recommended; controlled provider access. Account ownership and operating scope: TBC.

Target architecture, not a completed migration. AWS SA Region: Cape Town (af-south-1); Geo Rep region to confirm. [1]

Geo Rep should run the field experience

Build on the existing product; accept the mobile-to-Nexus workflow only after a representative field pilot.

Geo Rep advertises offline field capture and sales [2]. API access, LMS feeds, SSO and white-label rights require confirmation.

BENEFIT / DISADVANTAGE

Reuse established field workflows.
Reduce duplicate capture and app switching. Trade-off: dependence on the supplier, its API and licences.

PILOT ACCEPTANCE

Capture offline for a full shift.
Recover photo queues after restart.
Retry without duplicate orders.
Test speed on actual field devices.

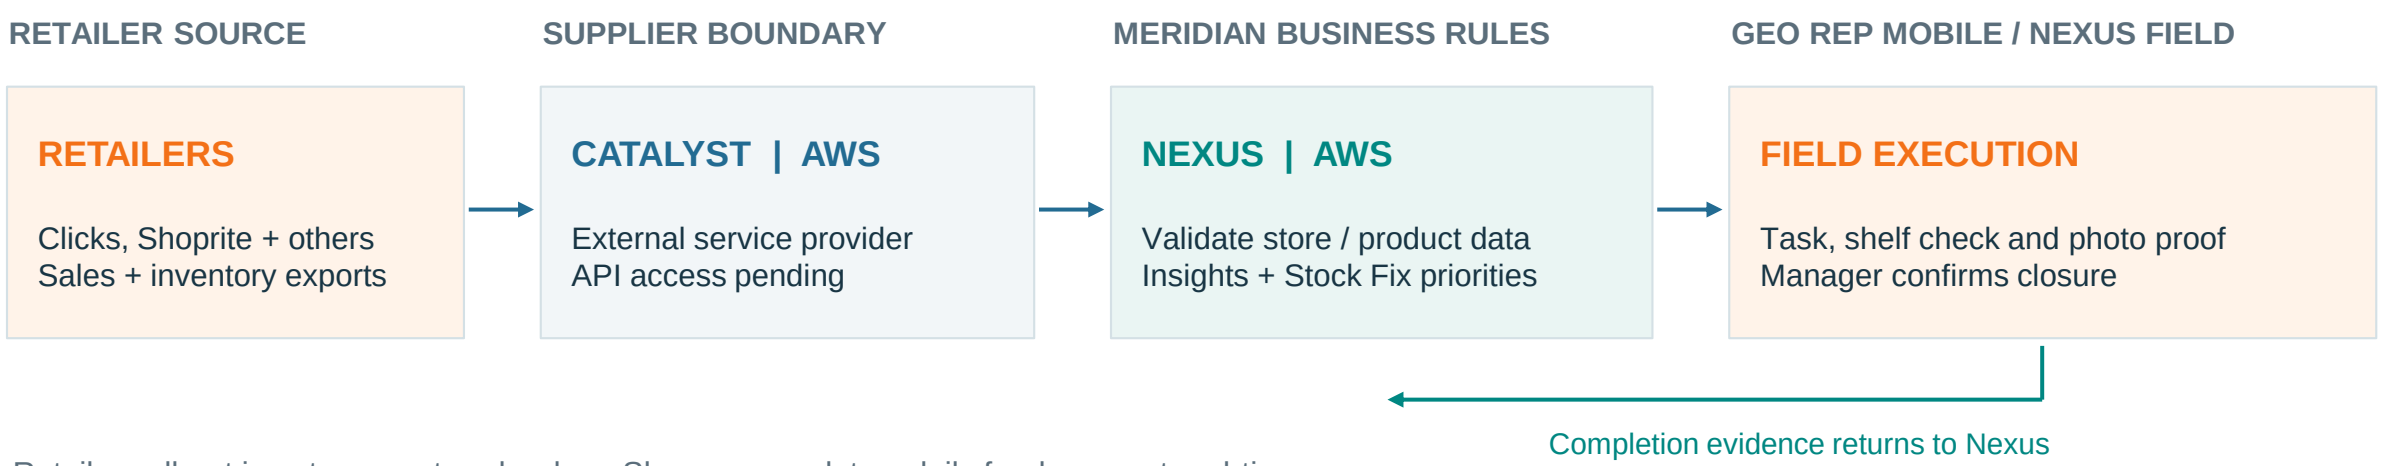

SECURITY + SERVICE

Client isolation; encrypted device data.
Lost-device controls; scoped GPS use.
Named support and incident SLAs.
Prove backups and restoration.

Geo Rep operates the service; Meridian retains product decisions, data access and release acceptance.

Catalyst data must drive action in store

Retailer sales and inventory identify the issue; the field visit verifies it, resolves it and provides evidence.

Retailer sell-out is not rep-captured orders. Show source dates; daily feeds are not real-time.

BENEFITS + RISKS

Focus visits on stock and sales gaps.
Risk: stale feeds, retailer access changes and incorrect SKU mapping.
Retain source lineage and retry alerts.

COSTS: QUOTE REQUIRED

36-month total: AWS + field licences + support + retailer feeds + migration + AI, image recognition and WhatsApp.
Track cost per field user / store visit.

APPROVAL GATES

1 Pilot Stock Fix; retain current service.
2 Reconcile feeds and test recovery.
3 Prove ordering, then AI / IR / WhatsApp.
Replace Catalyst only after acceptance.

Approve a scoped Geo Rep-managed AWS pilot, not an unconditional platform handover.

AWS consumption is usage-priced [3]; supplier fees, volumes and an approved budget remain unconfirmed.
